# Conferences

## 1 Statement of the problem and the potential of big business

A huge number of conferences are held around the world: scientific, educational and others. Some are onLine, others require personal presence, some are combined. It becomes more and more difficult to find current and relevant events in the selected country, city, which will be of interest to the current user.

## 2 Solutions

To solve this problem, I developed a web application that works with a database that already has 1) all the countries of the world, 2) major cities have been added to each country, and 3) sites from which events can be parsed, conferences of some universities are now being parsed , scientific events and news, but it is possible to connect other events (for example, sports or art).

Now it will not be difficult for ordinary users to find an event. To do this, go to the main page, select the country of interest.

After switching to a country, the user gets to a page where he can view upcoming events, news of the current day, refine the search by selecting a city and other services:

| Picture | Event name | Place of event | Date start |
|---|---|---|---|
| | The 17th Indonesian Regional Science Association (IRSA) Conference | Indonesian Regional Science Association (IRSA) Secretariat c/o Center for Economics and Development Studies (CEDS) Faculty of Economics and Business Padjadjaran University Jl. Cimandiri No. 6 Bandung – 40115 West Java | 2022-06-18 |
| | International Academic Conference on Economic and Social Development | mail.ssrglobal@gmail.com | 2022-03-15 |

# 3 Business model

There is no business model as such. There is a realized idea, but there is no management team that can offer a business strategy or model.

# 4 Potential Users

The resource can withstand the flow of users up to 100 thousand, or more, depending on the server. The number of potential users depends only on the chosen business model.
